

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	This morning, an intern told the IT team she couldn't log in to her work account. However, the logs showed her account was still being used to access customer records. She mentioned getting an email that asked her to log in on an outside website, which is likely how a hacker got into the system. Other employees also noticed that some customer records were missing or had wrong information, meaning the hacker not only saw the data but also changed or deleted some of it.
Identify	The incident response team checked the systems, devices, and access settings involved in the attack to find security weaknesses. They discovered that a hacker got the intern's login and password and used them to get into the customer database. At first glance, it looks like some customer data was deleted from the database.
Protect	The team added new login security rules to help stop this from happening again. This includes using multi-factor authentication (MFA), limiting logins to three tries, and training all employees on how to keep their passwords safe. They also plan to set up a stronger firewall and add an intrusion prevention system (IPS).
Detect	To spot any new unauthorized access in the future, the team will use a firewall

	logging tool and an intrusion detection system (IDS) to watch all incoming internet traffic.
Respond	The team disabled the intern's account to stop further access. We gave training to all interns and employees on how to keep their login details safe. Management was informed about the data breach and will contact customers by mail to let them know. They also plan to notify law enforcement and any other required organizations.
Recover	The team will restore the deleted data using last night's full backup. Staff were told that any customer information added or changed this morning isn't saved in that backup, so they'll need to re-enter it once the database is restored.
